

Telemetry Portal Vein Pressure

Surgery Code: TELEMPVP

The telemetry portal vein pressure model is of benefit to preclinical or research studies by recording unbiased physiological responses that transmit wirelessly, providing better data on the body's reactions to drugs/compounds.

Animal Models

Typical selections are listed below; however, choices for strain, age, and weight may be limited due to model anatomy and/or physiological conditions.

- Rats: male/female, any strain, weight \geq 200 g

Procedure Details

- **Perioperative care:** Please view our Pre- and Postoperative Care Sheet, which can be found at www.criver.com/opcare.
- **Housing:** The animals must be singly housed until suture/wound clips are removed.
- **Diet:** No special diet is required.
- **Postoperative holding period:** At a minimum, post-op animals are held 2 days, with the majority of the animals shipping within 7 days of surgery.
- **Maintenance:** Incision wound clips should be removed 7-10 days after surgery.

Surgical Summary

A ventral midline incision into the abdomen is made. The device pressure sensor catheter is inserted into the mesenteric vein and advanced to the portal vein.

The body of the transmitter is then slipped into the abdominal cavity. If the device has a suture tab, the tab is secured to the abdominal wall when closing the muscle with suture. The skin incision is closed with wound clips or suture per request.

IACUC

The Charles River Institutional Animal Care and Use Committee (IACUC) governs the entire surgical process, including all anesthesia, analgesia, animal preparation, and any postoperative holding in Charles River facilities prior to shipment. Review of experimental protocols, authorization to order animals that are surgically modified from Charles River, and all aspects concerning the use of the animals after they arrive at the institution are the responsibility of the receiving institution's IACUC.
