

## Chronic Constriction Injury (CCI)

### Surgery Code: BENNETT

The CCI (Bennett) model is a tool to study pharmacotherapy for chronic neuropathic pain. The model is used to identify experimental compounds with analgesic properties that are palliative for chronic neuropathic pain. The surgical procedure involves ligation of the sciatic nerve to create peripheral pain.

#### Animal Models

Male and female rat models, typically 100-250 g; anatomy and/or physiological limitations may dictate choice of strain, age and weight.

#### Procedure Details

- **Perioperative care:** Analgesia will not be provided to the animals pre- or post-surgery. Please view our Pre- and Postoperative Care Sheet, which can be found at [www.criver.com/opcare](http://www.criver.com/opcare).
- **Housing:** The animals must be group housed with additional bedding.
- **Diet:** No special diet is required.
- **Postoperative holding period:** At a minimum, post-op animals are held for 3 days, with the majority of animals shipping within 7 days of surgery.
- **Maintenance:** Incision wound clips should be removed 7-10 days after surgery.

#### Surgical Summary

A skin incision is made dorsal to the pelvis. The common sciatic nerve is first exposed by separating the muscles then loosely ligated with a chromic gut suture. Fascia and muscle is closed using sutures. The skin incision is closed with wound clips.

#### IACUC

The Charles River Institutional Animal Care and Use Committee (IACUC) governs the entire surgical process, including all anesthesia, analgesia, animal preparation and any postoperative holding in Charles River facilities prior to shipment. Review of experimental protocols, authorization to order animals that are surgically modified from Charles River, and all aspects concerning the use of the animals after they arrive at the institution are the responsibility of the receiving institution's IACUC.
