

Hysterectomy

Surgery Code: HYSTERX

The hysterectomy is of benefit to preclinical or research studies involving hormonal and reproductive physiology studies.

Animal Models

Typical selections are listed below; however, choices for strain, age and weight may be limited due to model anatomy and/or physiological conditions.

- Rats: female, any strain, age \geq 21 days old
- Mice: female, any strain, age \geq 21 days old

Procedure Details

- **Perioperative care:** Please view our Pre- and Postoperative Care Sheet, which can be found at www.criver.com/opcare.
- **Housing:** The animals can be group housed.
- **Diet:** No special diet is required.
- **Postoperative holding period:** At a minimum, post-op animals are held 2 days, with the majority of animals shipping within 7 days of surgery.
- **Maintenance:** Incision wound clips should be removed 7-10 days after surgery.

Surgical Summary

A ventral midline incision into the abdomen is made. Both ovaries are cauterized at the junction of the fallopian tube and the uterus. The fallopian tubes are cut caudal to the point of

cauterization, leaving the ovary in the abdomen. The vessels in the broad ligaments are identified, cauterized, and then cut distal to the cauterized section. A ligature is tied and the uterus is transected above the suture point. The organ is removed from the abdomen and the abdominal skin incision is closed with wound clips or per request.

IACUC

The Charles River Institutional Animal Care and Use Committee (IACUC) governs the entire surgical process, including all anesthesia, analgesia, animal preparation and any postoperative holding in Charles River facilities prior to shipment. Review of experimental protocols, authorization to order animals that are surgically modified from Charles River, and all aspects concerning the use of the animals after they arrive at the institution are the responsibility of the receiving institution's IACUC.
