

Ileum Catheter

Surgery Code: ILEUM

The ileum catheter is of benefit to preclinical or research studies as it allows for easy and/or repeated access to the ileum for dosing, without the need for anesthesia. This surgery is designed principally for pharmacologic studies, but may also be used for basic physiology studies where dosing to the ileum is necessary.

Animal Models

Male and female rat models, typically > 200 g; anatomy and/or physiological limitations may dictate choice of strain, age and weight.

Procedure Details

- Animals are fasted a minimum of 4 hours prior to surgery.
- **Perioperative care:** Please view our Pre- and Postoperative Care Sheet, which can be found at www.criver.com/opcare.
- **Housing:** The animals must be singly housed.
- **Diet:** No special diet is required.
- **Postoperative holding period:** At a minimum, post-op animals are held 2 days, with the majority of animals shipping within 7 days of surgery.
- **Maintenance:** Incision wound clips should be removed 7-10 days after surgery. Any wound clip used to secure a catheter needs to be replaced every 7-10 days. Catheters should be maintained following the Charles River Handling Instructions, which can be found at www.criver.com/handling.

Surgical Summary

The catheter is inserted into the ileum, passed through the abdominal wall, tunneled subcutaneously to the dorsal incision, exteriorized in the scapular region and secured.

IACUC

The Charles River Institutional Animal Care and Use Committee (IACUC) governs the entire surgical process, including all anesthesia, analgesia, animal preparation and any postoperative holding in Charles River facilities prior to shipment. Review of experimental protocols, authorization to order animals that are surgically modified from Charles River, and all aspects concerning the use of the animals after they arrive at the institution are the responsibility of the receiving institution's IACUC.
