Spontaneous Neoplastic Lesions and Survival in Crl:CD®(SD)BR Rats Maintained on Dietary Restriction

INTRODUCTION:

The use of some form of dietary restriction, also referred to as dietary optimization, is becoming increasingly common in standard toxicology studies as it is thought to result in healthier animals than the traditional *ad libitum* feeding regimen (1, 2, 3, 4, 5). The data presented in these tables were gathered from 26 toxicology studies of approximately 104 weeks duration in which some form of dietary restriction was employed. All studies were performed in the United States or Europe by contract laboratories or industrial toxicology facilities.

PURPOSE:

The purpose of this compilation is to offer the study director, reviewing toxicologist and/or study pathologist some reported incidences of neoplasms in Crl:CD®(SD)BR rats maintained throughout the duration of 104 week studies on a regimen of dietary restriction. Diagnoses in the compilations are intentionally grouped in a manner to provide the user with a range of reported incidences of similar types of lesions. This compilation is not intended in any way to propose a system of standardized nomenclature nor does it separately include each and every reported variant of each lesion.

COMMON STUDY PARAMETERS:

The 26 studies included in this publication were initiated between December 1989 and April 1995 in four different laboratories. All studies used Crl:CD®(SD)BR rats from three different Charles River Laboratories production sites: animals in studies A through F were from France, animals in study V were from Portage, Michigan and animals from the remaining 19 studies were from Raleigh, North Carolina.

The rats in these studies were from control groups of dietary or gavage studies and were approximately 4-8 weeks of age at study initiation. Some groups were untreated while others received 1.0% polyethylene glycol; 0.5% aqueous methylcellulose; 1.0% aqueous carboxymethylcellulose; or deionized water as the vehicle control.

Rats included in this publication were singly housed in stainless steel wire mesh cages with free access to water. The animal rooms were generally maintained at average temperatures of 72 +/- 5 degrees Fahrenheit with an average relative humidity of 30-70%. A 12hr/12hr light/dark cycle was employed in all studies. Since these studies were conducted in different facilities, there was some variation in environmental conditions. However, the overall environmental conditions were not considered by those performing the studies to have had any effect on the quality or integrity of the studies. Rats in studies A through F were fed measured amounts of UAR A04C feed with a physiological fuel value of 3.3 kcal/g and rats in all other studies received measured amounts of Purina PMI Certified Rodent Chow 5002 with a physiological fuel value of 3.4 kcal/g. The amount of feed consumed ranged from 14.5 to 17 grams for females and 20.5 to 24 grams for males. The actual amount of feed consumed per day and its respective calculated physiological fuel value are presented by study in Table 3.

Information on health assessment monitoring, other than that associated with pathological examination conducted in accordance with scheduled or moribund sacrifices, was not available.

DATA SETS PRESENTED:

The overall incidences of all neoplastic lesions observed in any organ are reported and summarized in Tables 4 and 5. These data also include neoplastic lesions from rats which died or were found moribund and killed prior to terminal sacrifice. It does not include information from rats which were killed for an interim sacrifice. Due to the apparent diversity in terminology and the variability among studies in the incidence of particular lesions, the individual study incidences of lesions in selected

organs/systems are also presented (Tables 6 and 7). These organs/systems include liver; pituitary; thyroid; adrenal; pancreas; mammary gland; lymphoreticular system and whole body/multiple organ.

Survival data are presented by study as the actual number surviving to terminal sacrifice and as percent survival at terminal sacrifice (Tables 1 and 2). The survival data are also presented in graphic form (Graphs 1 and 2). Survival data are not included for studies W-Z as they were not available at the time of publication.

SUMMARY TABLE CALCULATIONS:

The following is a description of how each of the parameters in the tables was calculated.

Number of Studies (# Studies)

This is the number of studies in which a particular tissue/organ was examined. In this presentation, the number of studies is always 26.

Total Number of Organs (Total # Organs)

This number represents the sum of the total number of tissues or organs examined in all control groups from all studies combined. Widespread tumors which showed involvement of multiple organs were listed on the basis of total number of animals examined. Occasionally a tumor would be noticed in a tissue not designated for histological examination by the study protocol. In these instances, the tumor incidence was based on the total number of animals examined as any such tumor or lesion would have been noticed on gross examination of the animal. Autolysis of tissues did not routinely exclude tissues from diagnosis. Tissue numbers were adjusted only if the individual study table indicated that some tissues were missing or inadequate for examination. Some laboratories presented data separately for different regions within an organ (i.e., duodenum, jejunum and ileum) while most presented data by the organ (i.e., small intestine). When data were presented separately by organ region, it was grouped under the organ and calculations were based on the number of organs examined.

Total Number of Lesions (# Lesions)

This represents the total number of occurrences of this lesion in the specified organ in all studies examined.

Percent of Total

These values represent the percent incidence of a particular lesion/diagnosis in the total number (all studies combined) of a particular organ examined. These values were calculated by dividing the total number of lesions by the total number of organs/animals examined and multiplying by 100 to express the values as a percent. Values are expressed to the second decimal place. Some caution is indicated in using this number, since not all pathologists or institutions will include all diagnoses in their lexicon.

Number of Studies Using This Diagnosis

This is the number of studies in which a particular diagnosis was reported. This number may be useful in interpreting the overall incidence (percent of total) of a particular diagnosis, see above.

Minimum and Maximum Percent Found (Minimum and Maximum % Found)

The range reported is the lowest and highest percent incidence for each lesion from the studies where the diagnosis was made. Therefore, if a study did not include a particular diagnosis, it was excluded from these calculations. The minimum and maximum percent found values should be considered in conjunction with the Number of Studies Using the Diagnosis.

The individual study percentages, Minimum % Found and Maximum % Found, were calculated by dividing the number of times each diagnosis was made by the total number of organs examined in each study and then multiplying the resultant value by 100 to express it as a percent. Values are expressed to the second decimal place.

SYNOMYS:

Synonymous terms or diagnoses were frequently encountered in different studies, and were combined under a single, often broad diagnosis, which was considered to be the primary diagnosis. Although some effort was made to use currently acceptable terms, it is beyond the scope of this publication to propose a system of preferred diagnoses. A current trend in toxicologic pathology is to simplify tumor classification (i.e., "lumping" as opposed to "splitting") and the categories of neoplasms used in this publication are considered to be consistent with that trend. The synonyms which were included in the various diagnoses are presented in the synonym list which follows. Where possible, terminology is consistent with the classification system proposed by the Society of Toxicologic Pathologists.

Stomach:

NONGLANDULAR MUCOSA/SQUAMOUS CELL PAPILLOMA = papilloma; non-glandular mucosa papilloma; squamous cell papilloma
NONGLANDULAR MUCOSA, CARCINOMA = squamous cell carcinoma

Liver:

BILE DUCT ADENOMA = cholangioma

Prostate:

CARCINOMA/CARCINOMA NOS = adenocarcinoma

Uterus:

ENDOMETRIAL STROMAL POLYP = polyp
ENDOMETRIUM, ADENOCARCINOMA = adenocarcinoma; endometrium, carcinoma
ENDOMETRIAL STROMAL SARCOMA = sarcoma

Skin:

BASAL CELL CARCINOMA = malignant basal cell tumor

Mammary Gland:

ADENOMA = cystadenoma

Adrenal:

CORTEX, CARCINOMA= cortex, adenocarcinoma

Pancreas:

ISLET CELL, ADENOMA= islet, adenoma; adenoma NOS
ISLET CELL, CARCINOMA = islet cell, adenocarcinoma; islet, carcinoma

Pituitary:

ADENOMA = adenoma anterior lobe; adenoma pars distalis
CARCINOMA = carcinoma pars distalis; adenocarcinoma; adenocarcinoma pars distalis

Thyroid:

C-CELL = parafollicular cell
FOLLICULAR CELL CARCINOMA = follicular cell adenocarcinoma

Body:

WHOLE BODY/MULTIPLE ORGAN = primary site undetermined

ABBREVIATIONS:

NOS = not otherwise specified.

ACKNOWLEDGEMENTS:

Our thanks to Joseph Frank, Janice Van Dyke and all of the contributing laboratories without whose help this publication would not have been possible.
